Characteristics and Impact of Student Aggression and Violence Against K-12 Teachers: An Egocentric Network Analysis

Authors: Ella Rho, M.S. & Chunyan Yang, Ph.D.

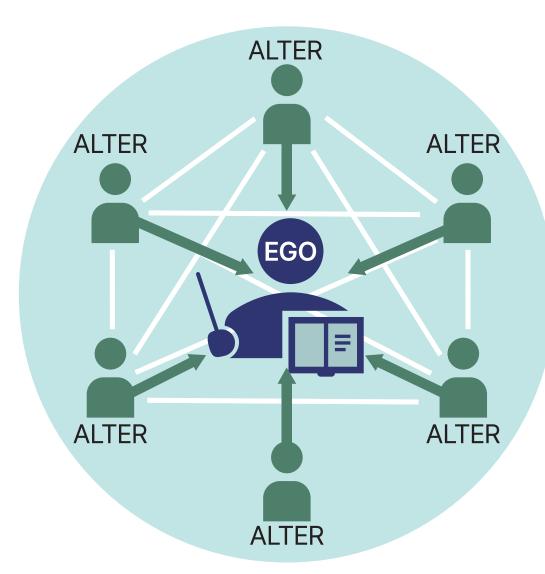

Introduction

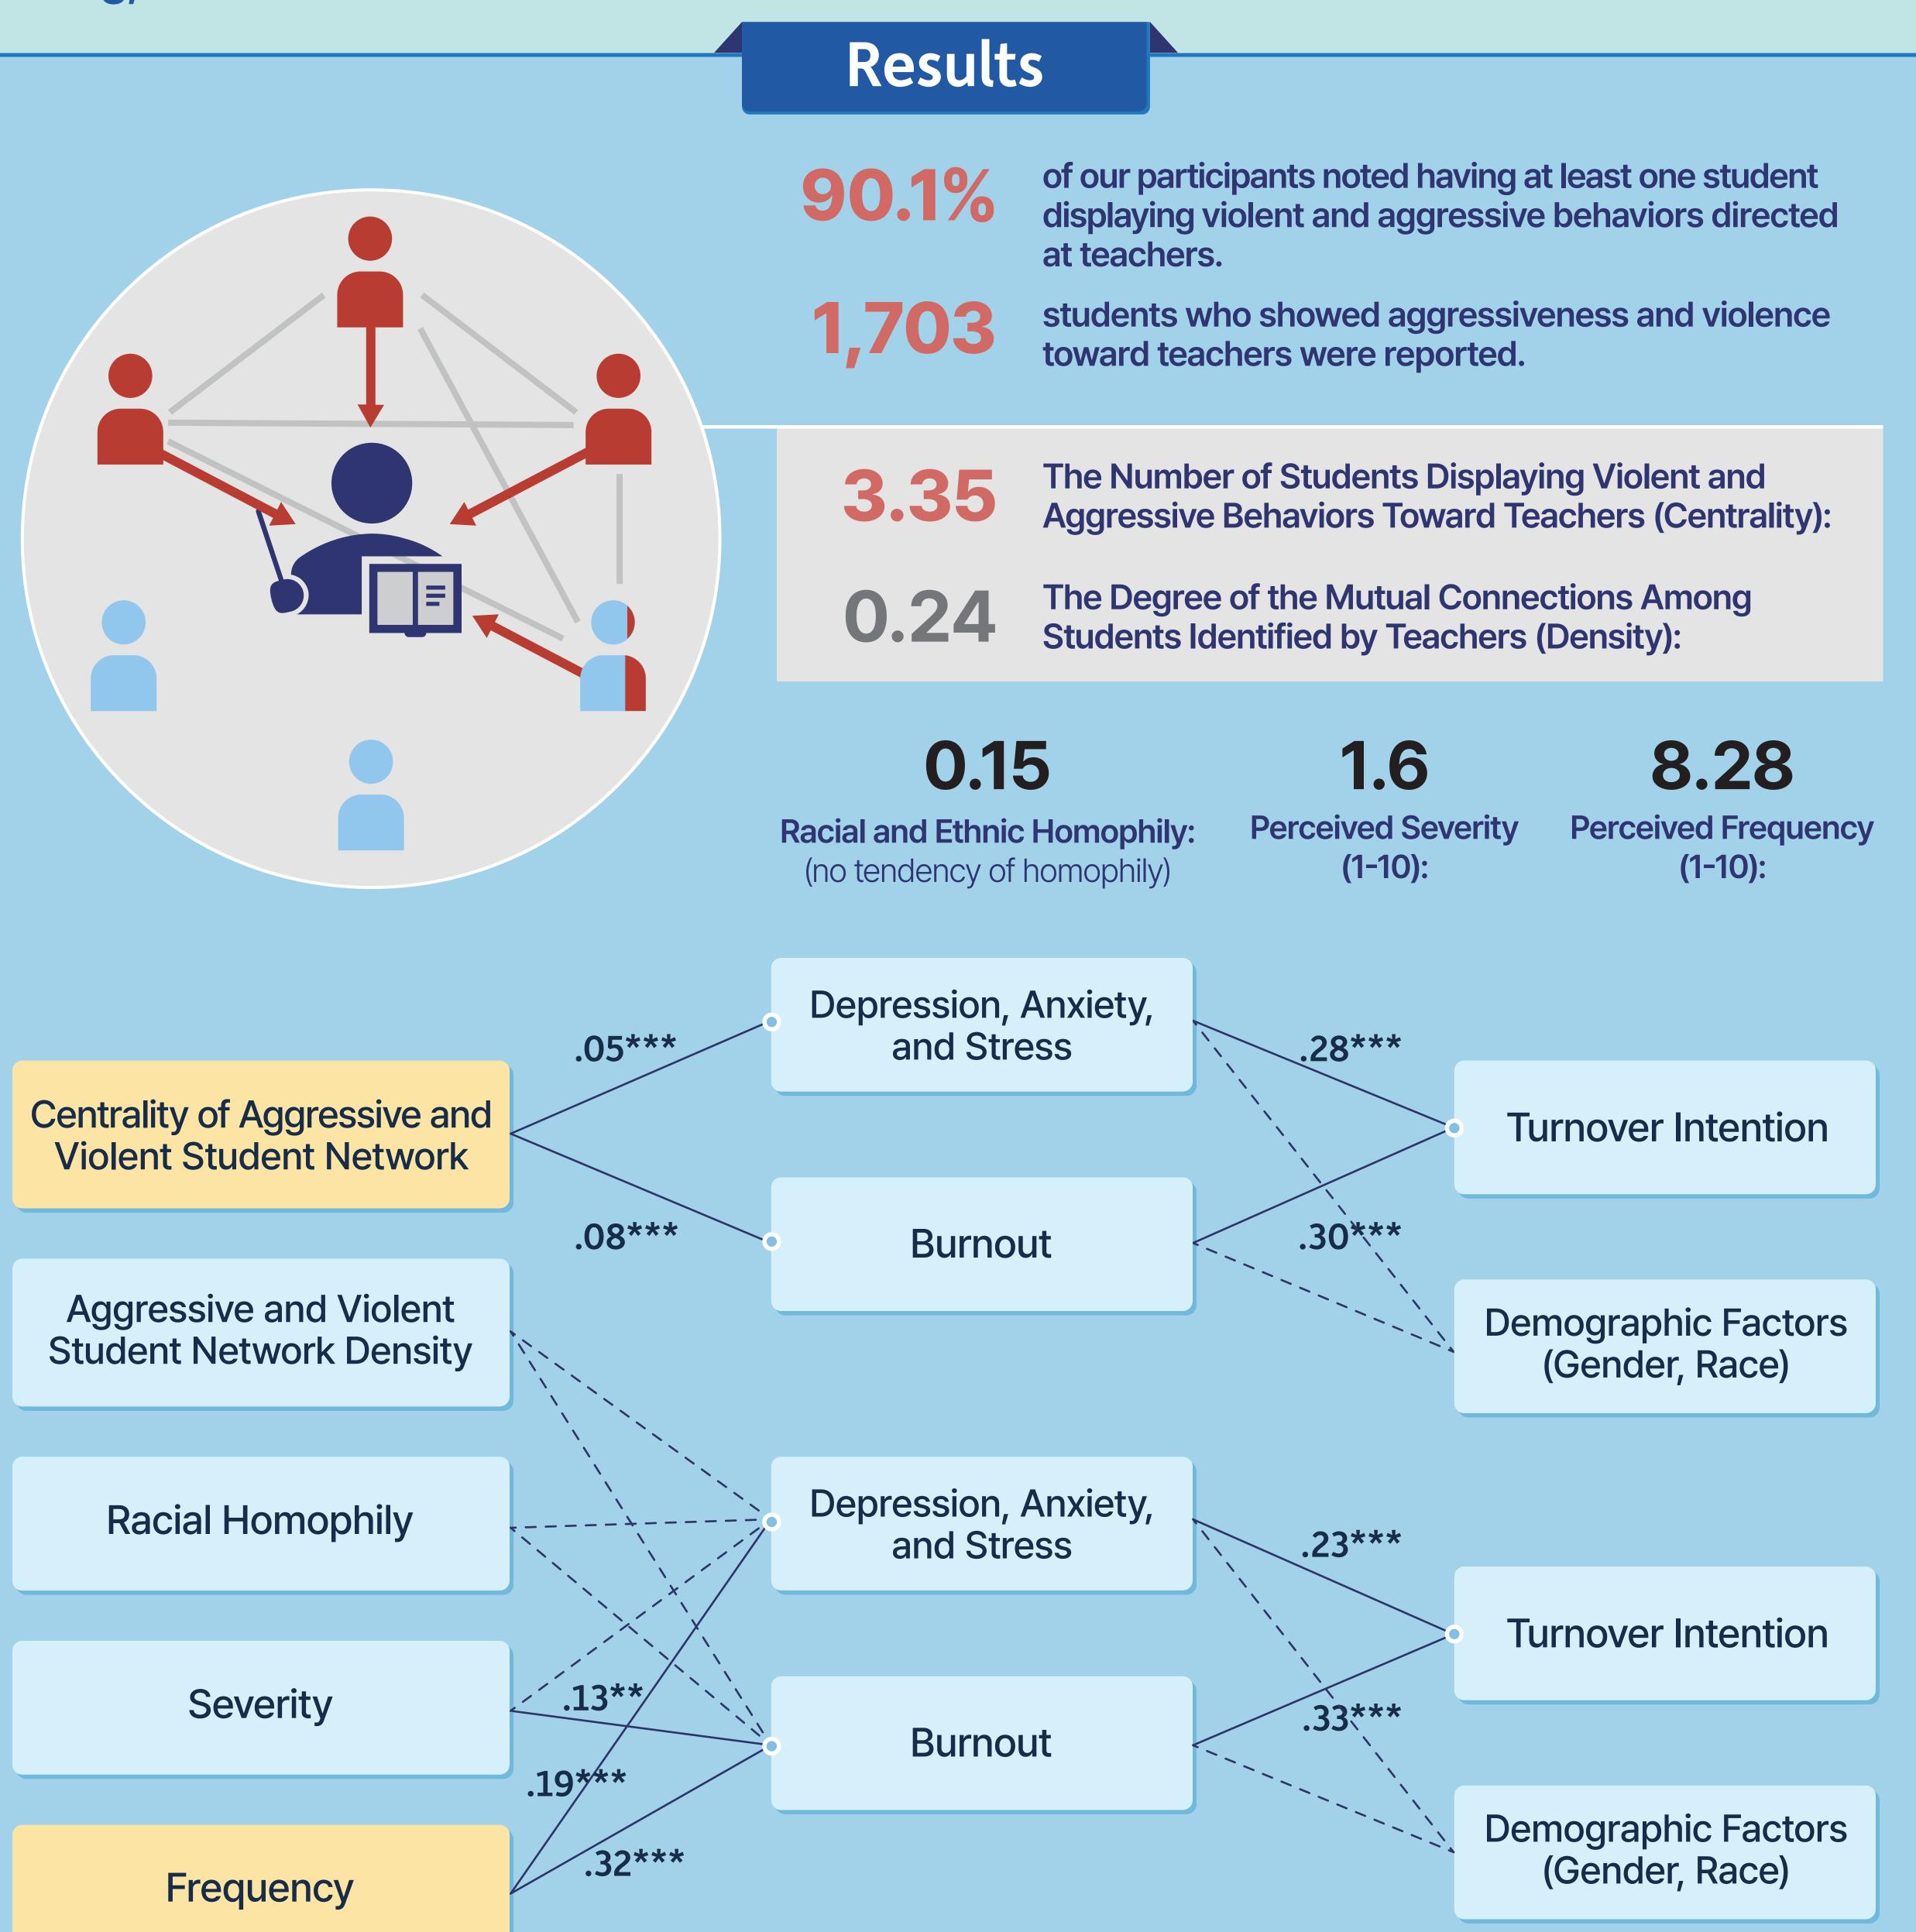

- A significant increase in threats and aggression toward teachers (Teacher Victimization; TV) has been noted, with incidents nearly doubling from 4.8% in 2009-2010 to 9.8% in 2019-2020 (NCES,
- However, no study has yet used network theory to examine TV and the impact of teachers' network with aggressive and violent students on psychological distress and burnout, as well as turnover intentions.

Methods

- We adopted a quantitative egocentric network analysis and path analysis.
- Our sample included 507 K-12 teachers in the U.S. (74.56% female, 24.85% male, 0.59% non-binary).
- Data collection occured between the Spring and Summer of 2023.

- Centrality The number of alters tied to an ego (Freeman, 1979)
- Density The number of ties in a network among alters (alters-alters) as a ratio of the maximum ties (Chung et al., 2005)
- Homophily El index (Newman, 2002)
- was used to calculate the homophily. -1 means complete homophily and 1 means heterophily.

Discussion

Network Characteristics

- Prevalence: TV is widespread; 90.1% encountered aggressive students.
- Centrality and Density: Teachers typically face around 3.35 aggressive students, often acting individually rather than in groups.
- Homophily: Aggressive students rarely share teachers' racial backgrounds, indicating diverse origins of behavior.
- Frequency and Severity: TV is pervasive but not intensely severe.

Impact of Centrality

- Linked the size of aggressive student networks to increased teacher burnout, and distress, subsequently turnover.
- This finding aligns with previous studies on TV and broader research on workplace bullying (Yang et al., 2022; Kollerova et al., 2023), indicating the negative mental health impacts of victimization.

Impact of Network Traits

- Density and homophily were not significant factors in teacher burnout or psychological distress.
- This constrasts with student bullying studies (Rigby et al., 2020), indicating group bullying has a more significant impact than individual acts. \rightarrow Teacher context may differ due to school-level support for collective issues.
- Addressing the frequency of aggressive incidents is crucial for managing teacher burnout and distress, subsequently turnover intention.
